STATEMENTS

Conditional statements

Conditional statements in C are programming constructs that allow a program to execute different blocks of code based on whether a certain condition is true or false. The most common types of conditional statements in C are the if, else if, and else statements.

They can be used for a lot of things such as error handling, and they are very easy to understand. Basically, those statements are always followed by a condition you are thinking about. If the condition is fulfilled by, for example, user input, your program will behave in a different way.
